Should I Care or Should I Work? Multigenerational Effects of Long-Term Care, with [Katja Kaufmann](#)

We analyze the spillover effects of long-term care arrangements within families across three generations. Using administrative data on the Dutch population, we evaluate the impact of a 2015 reform to public long-term care in the Netherlands, which promoted aging in place and introduced stricter criteria for nursing home access. We compare the labor supply adjustments of families with elders who lost access with those who remained eligible post-reform, in a Difference-in-Differences design. Losing access to nursing homes decreased sons' wealth, while children's overall labor supply was unaffected. We examine heterogeneous responses by family composition, individual opportunity costs, socioeconomic status, and location. Sons' wealth decreases independently of these characteristics, except if they do not have siblings. Daughters, however, increase labor supply, both at the extensive and intensive margin, when they do not have siblings or when their hourly wage is higher than the opportunity cost of informal caregiving. Granddaughters from smaller families decrease their labor supply three years after their grandparents lost nursing home access. Long-term analysis reveals that once elders' health deteriorates to the point where they qualify for nursing home entry, both children and grandchildren increase their labor supply. However, sons' wealth does not recover.
